What is Arthritis?

Arthritis is a group of conditions that causes pain and inflammation to joint cartilage in the body. Joints are the areas where two bones meet such as the knee, hip, shoulder or elbow. They allow our bodies to move in many different ways. Damage to the joints can result in joint weakness, instability, decreased movement and visible deformities.

Over time, as the body ages, our joints naturally degenerate. However, when someone complains of pain and stiffness in their bodies, or that their hands or hip are too sore to move, it may be as a direct result of arthritis.

If left untreated, arthritis has a debilitating effect on sufferers interfering with their quality of life and lifestyle. As arthritis becomes increasingly painful and disabling, the most basic daily tasks such as walking, brushing your teeth, driving or working at a computer can be hampered. Arthritis affects millions of people around the world. While it is most common in people over 60 years, arthritis can affect all age groups - even infants and children.

Arthritis vs. Rheumatism

People also often refer to arthritis as rheumatism. Arthritis is a very general term used to describe any aches and pains in the bones, muscles and joints. The term rheumatism is often colloquially used in the same context as arthritis although technically it refers to a group of conditions affecting not only the joints but also muscles, ligaments, cartilage, and tendons. Rheumatic diseases also have the potential to affect internal body areas.

Diagnosing Arthritis

There are many different signs and symptoms of arthritis. People with arthritis often experience joint pain, inflammation, stiffness or swelling around a joint. Joints that are inflamed may be reddish in appearance, warm to the touch, swollen or tender. Arthritis symptoms may flare up suddenly or appear gradually over a period of time. They may also be accompanied by fatigue, insomnia, depression and muscle aches.

The diagnosis of arthritis is based on your symptoms, physical examination and medical history. Additional tests such as X-rays and blood tests may be ordered by your physician to determine the type and the severity of the arthritis. As there are various types of arthritis, you may also be referred to a rheumatologist (specialist in arthritis) for further examination.
Types of Arthritis

Arthritis is not only isolated to the joints. Many forms of arthritis can affect the whole body including eyes, skin, chest (including the heart), lungs, and kidneys. While the term arthritis is often used as if it is one particular disease, there are in fact more than 100 different medical conditions that can be classified as a type of arthritic or rheumatic disease. The two most common forms of arthritis are osteoarthritis and rheumatoid arthritis.

Osteoarthritis is often associated with osteoporosis, which is the form that is usually brought about by age. It is a degenerative joint disease caused by the wear and tear and eventual loss of cartilage in one or more joints. Most often, it affects the fingers, hips and knees.

Rheumatoid arthritis is an auto-immune disease (when the body's own defense system does not work properly) that causes inflammation of the joints. Rheumatoid arthritis symptoms occur if the joint lining becomes inflamed when the body’s immune system attacks it and breaks it down. Rheumatoid arthritis symptoms affect joints and bones (most commonly the hands and feet) as well as body organs. Rheumatoid arthritis symptoms can be debilitating and this disease is one of the more serious forms of arthritis and typically women are affected more than men.

Other Common Forms of Arthritis

- **Gout** which is a result of a defect in the body chemistry causing increased levels of uric acid in the bloodstream. It is extremely painful, often attacking small joints, the most common and well known being the base of the big toe. It mostly affects men but fortunately can often be controlled with natural treatment and changes in diet.
- **Lupus** is a systemic auto-immune disorder that can inflame and harm the joints, the heart, the skin, the kidneys, and other organs.
- **Viral hepatitis** is an infection of the liver and secondary joint involvement can occur.
- **Ankylosing spondylitis** is a type of arthritis that affects the spine. It is brought about by inflammation, and causes the bones of the spine to grow together and fuse, resulting in decreased mobility and deformity.
- **Juvenile arthritis** is a general term for all types of arthritis that occur in children. Children may develop juvenile rheumatoid arthritis or childhood forms of lupus, ankylosing spondylitis or other types of arthritis.
- **Scleroderma** is a disease of the body’s connective tissue that causes a thickening and hardening of the skin and can involve the joints.
- **Fibromyalgia** mostly affects women and causes extensive pain that affects the muscles and attachments to the bone and joints.

What Causes Arthritis?

There are several factors that can contribute to the development of an arthritic condition, and sometimes several may come together to create an arthritic condition.
Causes of Arthritis

- Genetics
- Being overweight
- Age
- Metabolic disorders, immune disorders or inflammatory disorders
- Chronic stress across joints or joint trauma
- Nutritional deficiencies
- Certain occupational hazards such as working in heavy construction or on an assembly line

Help for Arthritis

Arthritis treatment is specifically aimed at providing pain relief. Treatment generally depends on the type of arthritis you have. Conventional medications include analgesics (aspirin or acetaminophen), NSAIDs (nonsteroidal anti-inflammatory drugs) or anti-inflammatory drugs such as corticosteroids or immunosuppressive agents may be used.

It is important to discuss these medications with your physician as many of these agents have damaging side effects, especially when used long term as is the case in chronic conditions like arthritis.

Supportive treatments such as physical therapy, hydrotherapy, mobilization, tens, relaxation therapy or acupuncture can also reduce pain, inflammation and stiffness.

Natural Remedies and Arthritis

More and more arthritis sufferers, particularly those with chronic conditions, are turning to natural and holistic treatments because conventional medicine has failed to produce the desired results. Natural arthritis pain relief can be obtained with treatments such as herbal and homeopathic remedies that are gentle and mild, yet effective and offer symptomatic relief. Ingredients such as Glucosamine can be used to provide natural arthritis pain relief and to repair cartilage and maintain joint mobility while Boswellia acts as a natural anti-inflammatory.

Clinical studies have proven the effectiveness of Devil's Claw in treating joint conditions like osteo-arthritis, fibrositis, rheumatism and small joint disease. Other useful herbs for natural arthritis pain relief like Alfalfa (Medicago sativa) can help to soothe the affected area, in a gentle manner without harsh side effects – helping with the recovery process. Cayenne can also be used in an infused oil to rub into arthritic joints for added relief.

Remember to obtain all herbal and homeopathic remedies from a reputable source.

Coping with Arthritis

Learning to manage the pain associated with the various forms of arthritis can be extremely difficult. Whether your symptoms are moderate or severe, there are...
some helpful techniques to cope with pain and create positive results.

**Gentle exercise** such as swimming, biking and water aerobics can reduce joint pain. Exercise increases blood flow, builds strong muscles and minimizes the chances of injury. Stretching or range-of-motion exercises help you stay flexible while preventing stiffness and joint deformities. Applying heat and cold to painful or stiff joints also provides temporary relief.

It is very important to also listen to your body and to discontinue activities that cause pain. If you are overweight or obese, you would need to **control your weight** if it is placing strain on your knees or ankles. Follow a healthy eating plan or natural weight loss program under the strict supervision of a doctor or dietician.

**Make your life as easy as possible** – walk around periodically and avoid remaining in the same position for a long time. Take regular breaks when performing tasks, sit on high back chairs rather than chairs without support and avoid placing unnecessary pressure on the area affected by pain or inflammation. Use helpful devices such as a cane, crutches, walker or cart to pull heavy items.

**Arthritis** is often a chronic disease that will probably be with you for the rest of your life. The pain and discomfort of arthritis can be debilitating and often brings about feelings of depression, anger, and isolation. **Deal with your emotions in a positive manner** with the help of relaxation techniques.

**Practice breathing techniques, positive thoughts, meditation** or listen to calming music to release stress and tension. Gain the support of family and friends to help you to achieve optimal health and well-being.

**The Natural Approach**

While Western medicine has become the norm in many cultures, it is not the only treatment option. Conventional western medicine, often called allopathic medicine, is the system of medicine taught at most medical schools and most pharmaceutical and synthetic medicines are manufactured and marketed according to the principles of allopathic medicine. Allopathic medicine is also sometimes called orthodox medicine.

Because most of us in the Western world have grown up in a society in which allopathic medicine is the prevailing norm, we forget that, only a few decades ago, homeopathic, herbal and other natural medicines were commonly available – and freely used even by conventional doctors. While there are often heated debates about which system of medicine is ‘better’ than the other, many responsible doctors (whether they are allopathic or not) recognize that both have a role to play in the treatment program.

Natural medicine has often been frowned on by conventional doctors, especially by those who did not have sufficient knowledge of these medicines. However, it is encouraging to note that some medical schools are now beginning to re-introduce it into their course work, thereby providing doctors with a wider range of treatment options from which to choose. In many countries, especially in Europe, India and China, natural and homeopathic medicines are commonly prescribed by conventional doctors and represent a significant part of the total annual drug sales.
Naturopathy is a branch of medicine (just as allopathy is a branch of medicine) which operates according to the underlying philosophy that the body has an innate capacity to heal itself. While natural medicines are often called ‘alternative’ or ‘complimentary’ medicines, they are, in fact, a unique and independent form of medicine in their own right, well able to treat a variety of conditions. Perhaps the term ‘holistic’ medicine is more apt, given the broad range of treatment options and approaches which are to be found within the practice of natural medicine, which encompasses many different disciplines, including herbalism, homeopathy, iridology, osteopathy, chiropractic, therapeutic massage techniques, aromatherapy, acupuncture and many, many more.

Most naturopaths will use a variety of treatment modalities in order to treat their patients in a holistic way to support health, relieve symptoms and prevent future disease. In fact, even the World Health Organization defines health as being "... more than simply the absence of illness. It is the active state of physical, emotional, mental and social well-being." This is a wonderfully clear description of holistic or natural medicine, which strives to support health (thereby relieving or preventing symptoms), rather than simply eliminating disease.

Although allopathic medicine certainly has a role to play and has made a tremendous contribution to medical science during the past century, there is a growing perception that it is not the only answer and that, in many cases, holistic medicine can accomplish just as much, if not more – without the risk of side effects, addiction and sacrifice to health so commonly associated with pharmaceutical drugs. Contrary to common perception, and provided that they are manufactured in the correct way, natural medicines can work quickly and safely to promote healing.

In many cases, they can succeed where pharmaceutical drugs have failed. Despite frequent reports that they are ‘unproven’ and ‘untested’, the opposite is true. Natural medicines have a long history of usage and there is a wealth of empirical evidence to support their effectiveness and safety. In addition, active clinical research is carried out by many academic hospitals and universities to support the extensive traditional and empirical evidence behind natural medicines.

It is also important to know that, like any medicine, herbal and homeopathic medicines must be manufactured in the correct way, following acceptable procedures and manufacturing methods to ensure maximum effectiveness and safety. Due to the recent rise in popularity of natural remedies, many companies have sprung up to take advantage of the market. Unfortunately not all of them are equipped to manufacture to the correct standards, often resulting in a flood of inferior (and sometimes even unsafe) remedies onto the market – and giving natural remedies a bad name.

Even some pharmaceutical companies have rushed to claim their market share by producing so-called ‘standardized’ extracts of herbs and offering these as superior to the tried and tested methods of naturopathic manufacturing. Nothing could be further from the truth. While ‘standardized’ extracts may offer benefit of easy consistency of dosage (and cheaper more efficient production lines), they have grave disadvantages. These include an increase in side effects as the medicines produced in this manner lose the natural protective properties of the herbs. In some cases, these side effects have proved fatal – as was seen in the liver toxicity associated with standardized extracts of kava kava, a herb previously safely used for generations without any known side effects.
Most naturopaths recommend what is called the Full Spectrum Method of extraction – which retains the benefits of ALL the active ingredients within the herb as opposed to isolating only one – thereby providing a more complete treatment as well as superior protection against side effects.

Whatever your choice, always choose wisely. Research what is best for you. If you have a chronic or life threatening condition, don’t make changes without first discussing them with your doctor in order that your condition may be monitored. Well informed and supportive practitioners will support patients who want to take responsibility for their own health.

In the treatment of depression, the following herbal and homeopathic remedies are often used as part of the treatment plan.

**Related Natural Remedies:**

**JointEase Plus:** Promotes joint and muscular-skeletal system health.

JointEase Plus means freedom to walk and move with ease!

JointEase Plus contains 100% pure Harpagophytum procumbens, also known as 'Sengaparile,' 'Devil's Claw' or 'Duiwelsklou', because of the claw-like shape of its fruit. For thousands of years, the Khoisan people of the Kalahari Desert (in Southern Africa) have used Devil's Claw to promote healthy joints as well as for a digestive tonic.

Our new and even more powerful formula now combines Devil's Claw with Glucosamine sulphate and Boswellia serata, both in the forefront of latest developments in the natural promotion of joint and muscle health. (See more on these new ingredients in the 'Ingredients' section below)
